# Empathy Map

Understanding the primary user before designing the API

Project: AI WeatherWise API    Track: AI-ML & GEN-AI Track

Prepared: 07 October 2026    Team ID: Not provided

Maximum Marks: 5

## Team Members & Assigned Roles

| Team Member | Role |
|---|---|
| Jai Bharath A | Team Lead & Lead Backend/API Architect |
| Mukesh Balaji | Generative AI & Prompt Engineering Engineer |
| Yadagiri Mani | Database & Data Engineering Specialist |
| Deepak G | Security, Testing & Reliability Engineer |
| Naveen | API Integration, Documentation & Demonstration Engineer |

## Primary Persona

A student, commuter or working professional who checks weather before leaving home, travelling, exercising or planning outdoor activities. The user wants a quick answer—not a meteorology lesson.

| Says | Thinks | Does | Feels |
|---|---|---|---|
| “Will it rain?” | Can I travel safely? | Checks city weather | Uncertain when data is only numeric |
| “What should I wear?” | Do I need an umbrella? | Saves frequent cities | Wants convenience |
| “Is it too hot?” | Should I carry water? | Reads recommendations | Values practical advice |

## Pains

- Too many weather numbers without interpretation.
- Repeatedly checking several sources for practical advice.
- Generic recommendations that ignore current conditions.
- Loss of service when an external weather/AI API is unavailable.

## Gains

- One API response that combines observations with human-readable meaning.
- Personalized recommendations for clothing, commute and hydration.
- Saved locations for quick repeat access.
- Resilient responses even during upstream service failure.

## Design Implication

**The API should preserve raw weather data for transparency while adding an intelligence layer that explains the conditions. Gen-AI should be useful, but never become a single point of failure.**
